is considered in statement 2.5 of this chapter. There are no data—other than in perioperative nutrition—available on the effects of formulae enriched with glutamine or other immune modulating substances on the nutritional status of cancer patients.

Home parenteral nutrition (HPN) is the intravenous administration of nutrients carried out in the patient's home. This book analyses current practices in HPN, with a view to inform best practice, covering epidemiology of HPN in regions including the UK and Europe, USA and Australia, its role in the treatment of clinical conditions including gastrointestinal

disorders and cancer, ethical and legal aspects and patient quality of life.

Parenteral nutrition in general is required if nutritional needs cannot be met by oral or enteral feeding. In the paediatric patient, its initiation depends both on individual circumstances and the age and size of the infant or child. This compact reference work on parenteral nutrition in children is based on the 'Guidelines for Paediatric Parenteral Nutrition' that have been developed jointly by the European Society for Paediatric Gastroenterology, Hepatology and Nutrition (ESPGHAN) and the European Society for Clinical Nutrition and Metabolism

(ESPEN), in collaboration with the European Society for Paediatric Research (ESPR). These guidelines were based on systematic literature reviews as well as a formal consensus process of a multidisciplinary panel of professionals. However, as a result of the scarcity of good quality clinical trials in children, many of the recommendations were extrapolated from adult studies and based on expert opinion. A detailed analysis of the available data was performed, and for each statement, the level of evidence and grade of recommendation was assessed. This reference guide has been conceived as an aid for the treating physician to assist him in the decision process, thus being a valuable companion in clinical practice.

This book offers a pragmatic approach to day-to-day metabolic and nutritional care based on physiological considerations. Due to the numerous controversial trials published in the last 15 years, there is no clear guidance for intensive care physicians regarding the metabolic and nutritional management of patients. This has resulted in a return to underfeeding and related complications in most ICUs worldwide as shown by the latest Nutrition Day data. Using a structured, logical approach, the book examines practical solutions for artificial feeding in complex areas of

critical care (brain injuries, burns, cardiac failure, ECMO, intestinal failure, long term patient, renal failure, metabolic diseases, obesity, old patients) and discusses measurement of the results of metabolic interventions. It also includes dedicated chapters focusing on specific problems, in order to avoid complications. Critical Care Nutrition Therapy for Non-nutritionists is a valuable resource for all general ICUs and ICU subspecialties such as cardiovascular, neuro, gastrointestinal and burns ICUs.

Provides comprehensive and practical guidance for managing the nutritional requirements of critically ill patients and thereby improving prognosis.

This book offers health professionals the scientific rationale for parenteral nutrition, the basic techniques needed for successful parenteral nutrition support, and ways to avoid complications. It presents the basic concepts necessary for the safe delivery of parenteral nutrition, including metabolism of protein, and carbohydrate and fat; electrolytes, minerals; practical application of parenteral nutrition; and it discusses special pediatric conditions in which parenteral feeds are indicated and useful. Chapters written by expert contributors emphasize hands-on advice and a practical approach to successfully administering parenteral nutrition to children.

Traumatic brain injury (TBI) accounts for up to one-third of combat-related injuries in Iraq and Afghanistan, according to some estimates. TBI is also a major problem among civilians, especially those who engage in certain sports. At the request of the Department of Defense, the IOM examined the potential role of nutrition in the treatment of and resilience against TBI.
