Example 2: Consider the equation  $15(x + 9) = 24x + 9 - (9x - 126)$  Solving we have  $15x + 144 = 24x + 9 - 9x + 126$  or  $15x + 144 = 15x + 144$ . Subtracting  $15x$  from both sides.  $15x - 15x + 144 = 15x - 15x + 144$ .

Linear equations with one, zero, or infinite solutions ...

If a pair of the linear equations have unique or infinite solutions, then the system of equation is said to be a consistent pair of linear equations. Thus, suppose we have two equations in two variables as follows:  $a_1x + b_1y = c_1$  — (1)  $a_2x + b_2y = c_2$  — (2) The given equations are consistent and dependent and have infinitely many solutions, if and only if,  $(a_1/a_2) = (b_1/b_2) = (c_1/c_2)$  Conditions for Infinite Solution. An equation can have infinitely many ...

An infinite solution has both sides equal. For example,  $6x + 2y - 8 = 12x + 4y - 16$ . If you simplify the equation using an infinite solutions formula or method, you'll get both sides equal, hence, it is an infinite solution. Infinite represents limitless or unboundedness. It is usually represented by the symbol "∞".

Case 3: Infinite Solutions. This is the rarest case and only occurs when you have the same line. Consider, for instance, the two lines below ( $y = 2x + 1$  and  $2y = 4x + 2$ ). These two equations are really the same line. Example of a system that has infinite solutions: Line 1:  $y = 2x + 1$ . Line 2:  $2y = 4x + 2$ .

We're asked to use the drop-down to form a linear equation with infinitely many solutions. So an equation with infinitely many solutions essentially has the same thing on both sides, no matter what  $x$  you pick. So first, my brain just wants to simplify this left-hand side a little bit and then think about how I can engineer the right-hand side so it's going to be the same as the left no matter what  $x$  I pick.

Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form  $x = a$ ,  $a = a$ , or  $a = b$  results (where  $a$  and  $b$  are different numbers).

(5.1.1) – Define and classify solutions to systems of linear equations. A system of linear equations consists of two or more linear equations made up of two or more variables such that all equations in the system are considered simultaneously. To find the unique solution to a system of linear equations, we must find a numerical value for each variable in the system that will satisfy all ...

A solution of a linear system is an assignment of values to the variables  $x_1, x_2, \dots, x_n$  such that each of the equations is satisfied. The set of all possible solutions is called the solution set.. A linear system may behave in any one of three possible ways: The system has infinitely many solutions.; The system has a single unique solution.; The system has no solution.
