The third edition of this successful text gives a rigorous introduction to probability theory and the discussion of the most important random processes in some depth. It includes various topics which are suitable for undergraduate courses, but are not routinely taught. It is suitable to the beginner, and provides a taste and encouragement for more advanced work.

In probability theory, a martingale is a sequence of random variables (i.e., a stochastic process) for which, at a particular time, the

conditional expectation of the next value in the sequence is equal to the present value, regardless of all prior values.

In probability theory and related fields, a stochastic or random process is a mathematical object usually defined as a family of random variables. Many stochastic processes can be represented by time series. However, a stochastic process is by nature continuous while a time series is a set of observations indexed by integers.

One possibility is to pick at random a family, each family being chosen with equal probability, and talk about the expected value that you get, or the average value if you sample that way. In this particular example with probability $1/4$, you get a 1, with probability $1/4$, you get a 1 with probability $1/4$, you get a 1.

A random process is nothing but a collection of indexed random variables defined over a probability space. The index is in most cases time, but in general can be anything. This way of viewing a random process is advantageous, since we can derive the properties of the random process in terms of the properties of the random variables.
